## GOVERNMENT OF INDIA MINISTRY OF EARTH SCIENCES

## RAJYA SABHA

## **UNSTARRED QUESTION No. 2106**

ANSWERED ON 04/08/2022

### RAINFALL DEFICIT IN THE COUNTRY

### 2106. # SHRI RAM NATH THAKUR:

Will the Minister of EARTH SCIENCES be pleased to state:

- (a) the rainfall deficit in the country this year
- (b) the effect of climate change on monsoon in the form of rainfall deficit and whether the India Meteorological Department (IMD) is providing accurate data in public interest; and
- (c) the drought and flood affected areas where such situation occurred due to rainfall deficit and excess rainfall during this monsoon?

# ANSWER THE MINISTER OF STATE (INDEPENDENT CHARGE) OF MINSTRY OF SCIENCE AND TECHNOLOGY AND EARTH SCIENCES (DR. JITENDRA SINGH)

(a) This year the monsoon onset over Kerala was on 29<sup>th</sup> May, 2022 against the normal date of 01<sup>st</sup> June (3 days ahead of normal date) and it has covered the entire country on 2<sup>nd</sup> July 2022, against the normal date of 8<sup>th</sup> July i.e. six days ahead of the normal date for monsoon coverage for the entire country. The map related to Advance of Southwest monsoon 2022 is given in **Annexure-I**.

The monsoon rainfall had been normal [92% of the Long Period Average (LPA)] during June 2022, for the country as a whole; the LPA of the rainfall for the month of June being 165.4 mm based on the data of 1971-2020. The rainfall in June is said to be normal if it is within 92% to 108% of LPA.

Rainfall statistics for the month of June 2022 for the country as a whole and four homogeneous regions are given in the table below:

Region	Rainfall during 1-30 June 2022			
Region	Actual	Normal	% Departure	
EAST & NORTHEAST INDIA	400.9	328.4	22%	
NORTHWEST INDIA	68.6	78.1	-12%	
CENTRAL INDIA	118.9	170.3	-30%	
SOUTH PENINSULA INDIA	139	161	-14%	
COUNTRY AS A WHOLE	152.3	165.3	-8%	

From the above table it is found that there was excess rainfall over East & Northeast India and deficient rainfall over Central India.

Monsoon remained active in July due to formation and movement of low pressure systems across Central India and the monsoon trough lying to the south of its normal position. The details of seasonal rainfall for the country as a whole and for four homogeneous regions till 28<sup>th</sup> July are given below:

Region	Rainfall during 1 June to 28 July 2022			
	Actual	Normal	% Departure	
EAST & NORTHEAST INDIA	605.1	716.1	-15%	
NORTHWEST INDIA	273.4	266.2	+3%	
CENTRAL INDIA	565.8	460.0	+23%	
SOUTH PENINSULA INDIA	448.7	346.3	+30%	
COUNTRY AS A WHOLE	459.1	418.9	+10%	

It is clear from the above table that except for the east and northeast India all other parts of the country received normal to above normal monsoon rainfall.

(b) Ministry of Earth Sciences (MoES) is continuously undertaking research to conduct a detailed analysis to find out effect of climate change on monsoon.

The Ministry of Earth Sciences (MoES), has recently published a Climate Change report entitled "Assessment Climate Change over (http://cccr.tropmet.res.in/home/docs/cccr/2020\_Book\_AssessmentOfClimateChangeOver T.pdf). A salient feature of this report is the inclusion of introductory results based on the CMIP Phase 6 (CMIP6) projections of the Indian Institute of Tropical Meteorology (IITM) Earth System Model (IITM-ESM)—the first climate model from India developed at the Centre for Climate Change Research-IITM, which is contributing to the Sixth IPCC Assessment Report (IPCC AR6). With continued global warming and anticipated reductions in anthropogenic aerosol emissions in the future, CMIP5 models project an increase in the mean and variability of monsoon precipitation by the end of the twenty-first century, together with substantial increases in daily precipitation extremes.

IMD also brought out web based online "Climate Hazard & Vulnerability Atlas of India" prepared for the thirteen most hazardous meteorological events, which cause extensive damages, economic, human, and animal losses. The same can be accessed at https://imdpune.gov.in/hazardatlas/abouthazard.html. IMD has studied and investigated the observed changes of rainfall patterns and its extremes in the recent 30 years in different states and districts. 29 Reports of states and UTs on "Observed Rainfall Variability and Changes" have been published by IMD in January 2020. The reports are also available to the public on the **IMD** Pune website https://imdpune.gov.in/hydrology/rainfall%20variability%20page/rainfall%20trend.html)

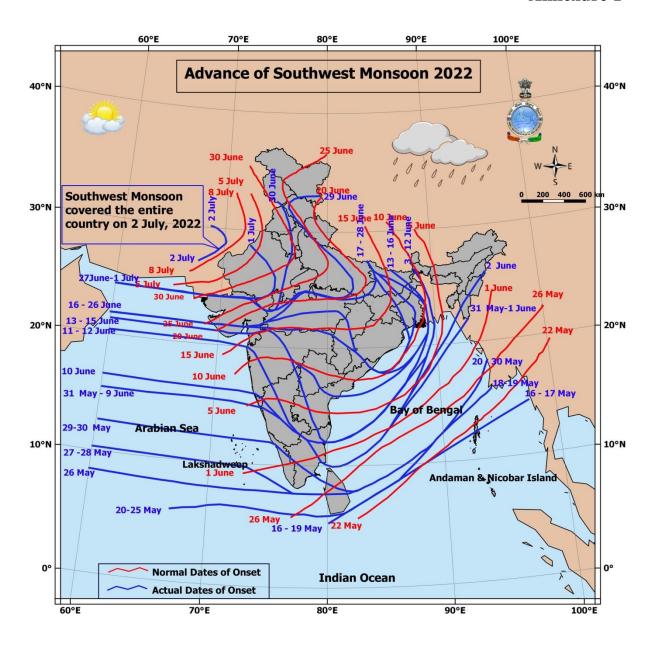

## The **highlights of the report** are given below:

- ➤ Five states viz., Uttar Pradesh, Bihar, West Bengal, Meghalaya and Nagaland have shown significant decreasing trends in southwest monsoon rainfall during the recent 30 years period (1989-2018).
- ➤ The annual rainfall over these five states along with the states of Arunachal Pradesh and Himachal Pradesh also show significant decreasing trends.
- ➤ Other states do not show any significant changes in southwest monsoon rainfall during the same period.
- ➤ Considering district-wise rainfall, there are many districts in the country, which show significant changes in southwest monsoon and annual rainfall during the recent 30 years period (1989-2018). With regard to the frequency of heavy rainfall days, significant increasing trend is observed over Saurashtra& Kutch, Southeastern parts of Rajasthan, Northern parts of Tamil Nadu, Northern parts of Andhra Pradesh and adjoining areas of Southwest Odisha, many parts of Chhattisgarh, Southwest Madhya Pradesh, West Bengal, Manipur & Mizoram, Konkan& Goa and Uttarakhand.

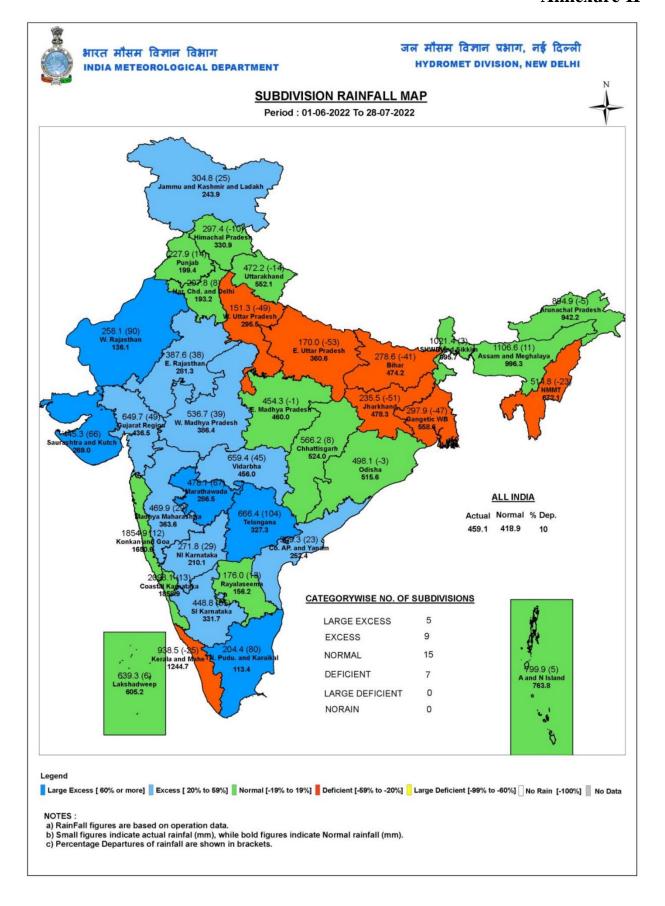

IMD is dedicated to monitoring, detecting, and forecasting weather and climate, including early warning for severe weather events. IMD issue forecast/outlook for rainfall in different spatial and time scales during different season, which will help to take appropriate/anticipatory action to overcome the weather and climate risks.

(c) Sub-division wise observed rainfall from 1 June to 28 July 2022 is provided as graph in Annexure II and the amount of rainfall and the rainfall statistics are provided in table in Annexure III. Following sub-divisions report deficitrainfall: West Uttar Pradesh, East Uttar Pradesh, Bihar Jharkhand, Gangetic West Bengal, Nagaland, Manipur, Meghalaya and Tripura and Kerala and Mahe. All other sub-divisional rainfall activity has been either normal or excess category.
